CONCEPT PRODUCT · PORTFOLIO CASE STUDY

LOOP

Messaging that turns conversations into actions

Ishita Mishra · Aspiring Product Manager (self-directed case study)

A messenger that turns “don’t forget” into a two-tap reminder — without ever leaving the chat.

Built end-to-end as a PM portfolio project: discovery, PRD, Figma-ready design and measurement plan .

The core problem

Important information gets buried in conversations.

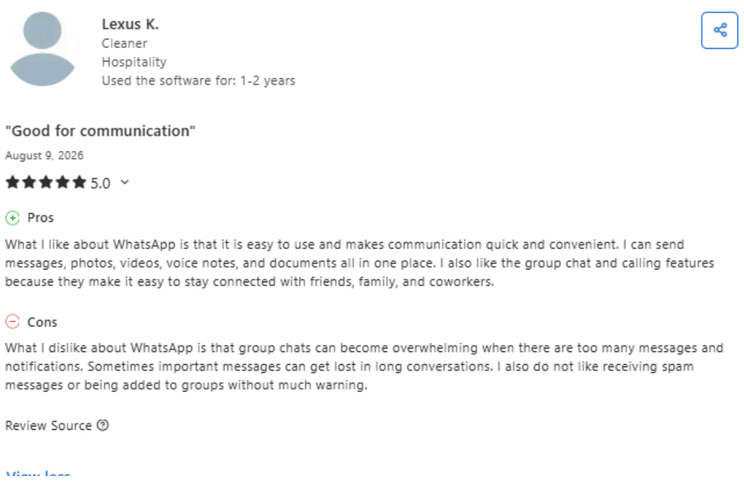

People understand a message the moment they read it — then rely on memory or a frantic re-scroll to act on it later. That gap, repeated across a day full of chats, is what Loop is built to close.

“Submit the assignment by Friday.”

“Meeting tomorrow at 10.”

“Don’t forget to book the tickets.”

“Can you send me the document by 6 PM?”

"Good for communication"
August 9, 2026
5.0

Pros
What I like about WhatsApp is that it is easy to use and makes communication quick and convenient. I can send messages, photos, videos, voice notes, and documents all in one place. I also like the group chat and calling features because they make it easy to stay connected with friends, family, and coworkers.

Cons
What I dislike about WhatsApp is that group chats can become overwhelming when there are too many messages and notifications. Sometimes important messages can get lost in long conversations. I also do not like receiving spam messages or being added to groups without much warning.

"Simple and convenient platform for messaging and group communication"
September 21, 2026
5.0

My overall experience with WhatsApp has been positive. The Ease of Use makes it convenient for everyday communication, while Messaging and Chat provide a simple way to communicate with individuals and groups. It is particularly useful for quick updates, coordination, and sharing files or media. Although there can occasionally be minor Bugs and Issues, they have not significantly affected my experience. I have limited direct experience with Customer Support, and Project Management is not a primary use case for me. Overall, I believe WhatsApp provides good Value for Money as a convenient communication and messaging platform.

Pros
WhatsApp is easy to use and provides good value for money for everyday communication. The Messaging and Chat features make it simple to communicate with individuals and groups, while media and document sharing make conversations more convenient. The interface is straightforward, so it is easy to start conversations and manage ongoing communication without much setup.

Cons
When there are many group conversations and messages, it can sometimes become difficult to keep track of important information. I have occasionally experienced minor bugs and issues such as delayed notifications or messages taking time to synchronize. Some group conversations can also become cluttered when there is a high volume of messages. I have limited direct experience with Customer Support, so I cannot strongly evaluate that aspect. Project Management is

Why solve this now

Messaging is the most-opened app category on any phone — any feature that lives inside the thread inherits that attention for free.

1

High-frequency surface

Reminders and tasks are usually a separate app. Messaging is opened dozens of times a day — a far cheaper place to capture a passing deadline than switching apps.

2

A gap competitors leave open

WhatsApp, Telegram and Slack each cover part of this (saving, pinning, basic reminders) but none turn a specific message into a reminder or task in one motion — see the matrix next.

3

Utility as a differentiator

A new messenger can’t win on network size. It can win on being useful even in a small group — a different kind of moat than reach.

4

Low cost to test

A message-to-action feature doesn’t need millions of users to validate — it needs a handful of real conversations. That makes the riskiest assumption cheap to test before investing further.

Product goals & how I'd measure winning

NORTH STAR METRIC

Weekly Actioned Users (WAcU)

Unique users per week who create an action from a message AND complete or acknowledge it — the moment the promise is kept, not just attempted.

G1 · Low effort to capture

Median time to save a reminder under 10 seconds, 3 taps or fewer.

G2 · Information becomes actionable

35% of weekly active users create at least one action (proposed target).

G3 · A returning habit

Weekly message-to-action completions trend up for 6 straight weeks in beta.

G4 · Retention through usefulness

Action-creators retained noticeably higher than non-creators (correlational — not proof of cause).

G5 · Stay calm, not naggy

No drop in messages sent or rise in notification opt-outs (guardrail).

Active Users → Creates Action → Completes It
500 200 140
(= WAcU, the North Star)

All targets above are PROPOSED — starting points for a beta baseline, not measured results.

Competitive landscape

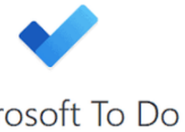

Where Loop sits relative to the products people already use — a feature-level comparison, not a market-share claim.

	Reminder from a message	Task from a message	Saved / bookmarked items	Notification tied to the action
WhatsApp	Partial / varies	Not core	Partial (star / pin)	Message-level only
Telegram	Partial (Saved Messages)	Not core	Strong (Saved Messages)	Message-level only
Slack	Partial (remind feature)	Partial	Partial	Partial
Loop	**Core, in 2 taps**	**Core, in 2 taps**	**Strong (Saved Actions hub)**	**Built for the action**

Feature reads are my own hands-on assessment of each product at time of writing and would need re-verifying against current versions before any external use.

Competitors

Who I’m building for

Primary: students and young professionals who coordinate deadlines and plans through chat. Secondary: group and family organisers.

Aarav, 20

2nd-year engineering student

GOAL

Never miss a submission; look reliable to teammates.

BEHAVIOUR

Checks chat between classes; many active group chats.

PAIN POINT

Deadlines shared in class groups get buried under memes and logistics.

CURRENT WORKAROUND

Screenshots and a separate notes app.

Meera, 26

Early-career analyst

GOAL

Follow through on small requests; keep work and personal plans separate

BEHAVIOUR

Checks chat in bursts; handles many small requests during meetings

PAIN POINT

Quick asks ('can you send it by 6?') get lost while she is in other work

CURRENT WORKAROUND

Marks chats unread; uses a to-do app when she remembers

Suresh, 45

Family organizer. Runs the family group chat and helps coordinate events with relatives.

GOAL

Everyone knows the plan, time and who is bringing what.

BEHAVIOUR

Posts plans in the group; answers questions repeatedly

PAIN POINT

Plans get repeated; some members miss details; he becomes the human reminder system.

CURRENT WORKAROUND

Pinned messages where available, phone calls, repeating himself.

Jobs to be done

Format: When [situation], I want to [motivation], so I can [outcome]

1. When I receive an important deadline in a chat, I want to save it as a reminder, so I do not have to search for it later.

2. When someone asks me to do something in a chat, I want to turn it into a task, so I can complete it and see it done.

3. When someone sends me an important document, address or detail, I want to save it somewhere accessible, so I can find it quickly later.

4. When a group discusses an upcoming event, I want to turn the relevant message into an event, so everyone knows what needs to happen.

5. When I am too busy to respond right now, I want to mark a message to deal with later, so I can stay focused without worrying I will forget.

6. When a chat gets long, I want to see the key decisions and dates, so I can catch up quickly.

Product strategy & scope

Vision: a world where nothing important gets lost in a conversation. The MVP tests the smallest complete loop — message in, action out, reminder back.

IN SCOPE — NOW

- ✓ Messaging core: 1:1 and group chat
- ✓ Message Actions menu (Save, Reminder, Task)
- ✓ Basic notifications for reminders
- ✓ Search across messages and actions
- ✓ Saved Actions hub

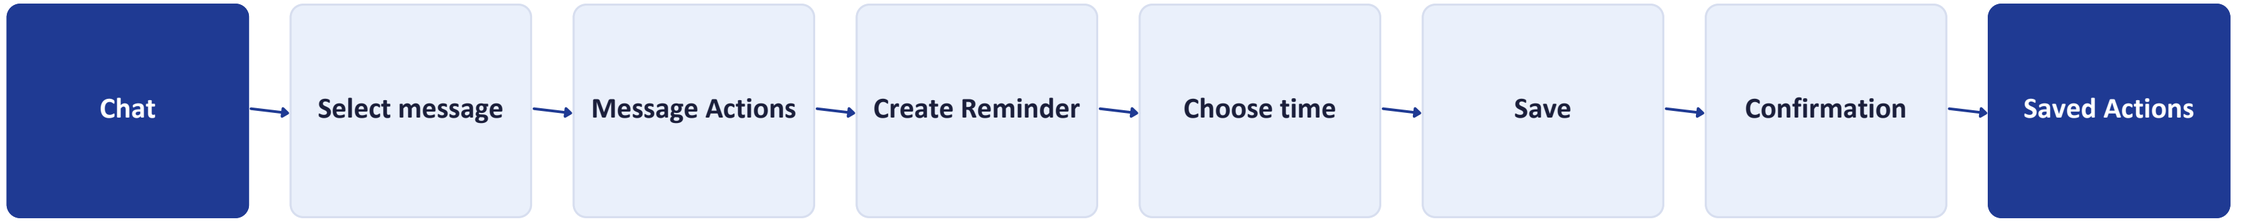

OUT OF SCOPE — DELIBERATELY

- × Events (needs shared group state)
- × Smart / automatic suggestions (privacy risk)
- × AI organisation of messages
- × Calendar & cross-platform integrations
- × Advanced automation

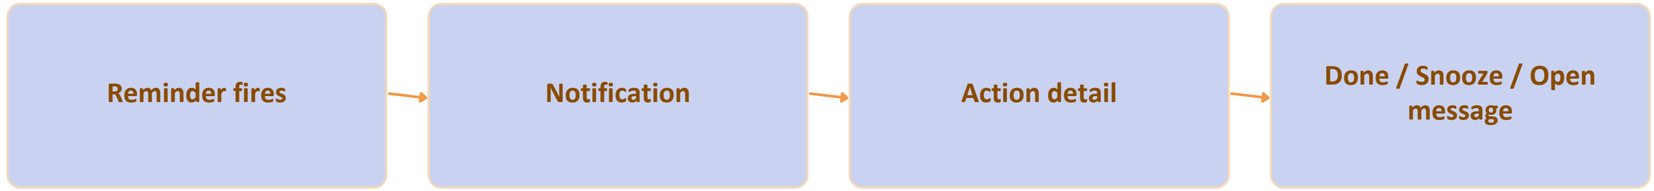

Scope decisions are RICE-informed, but RICE inputs are my own hypothetical scoring — not measured data (full table in the appendix doc).

Core user journey: message → action

The primary flow every other design decision is built around.

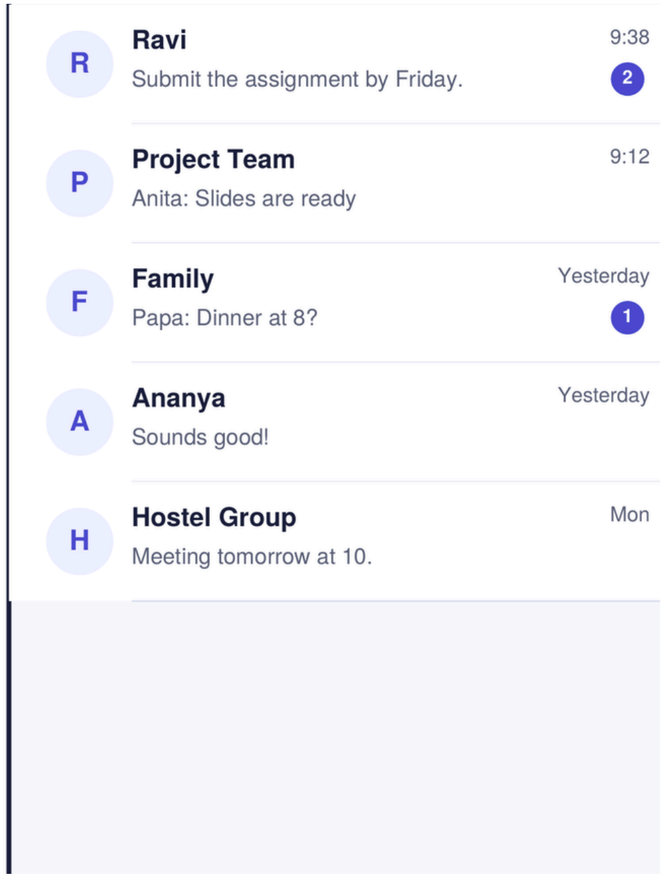

Then, independently: a reminder notification arrives → opens the action detail → Done, Snooze, or jump to the source message.

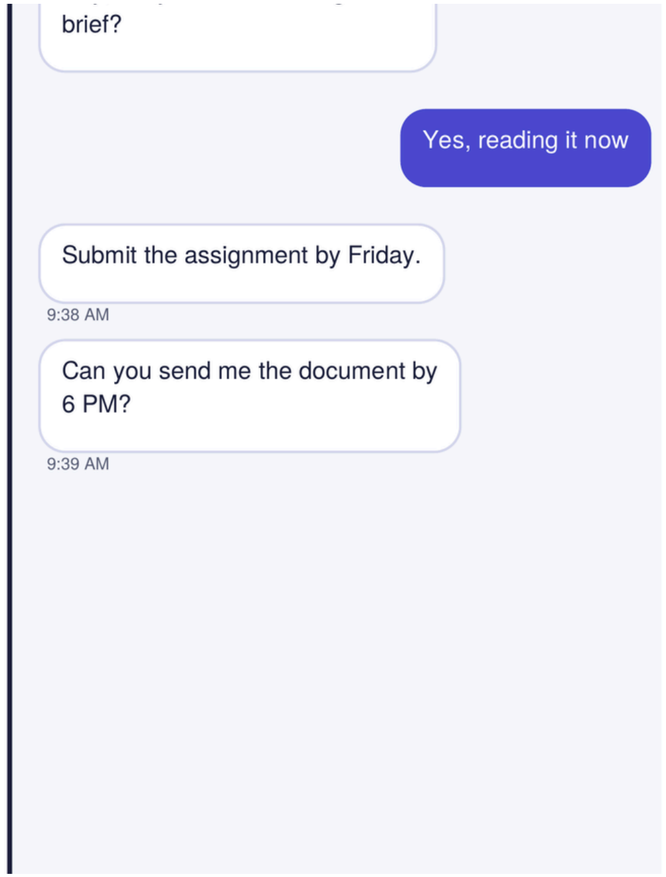

Full edge cases (duplicate reminders, past times, offline saves, deleted source messages) are mapped slide 13 and in the appendix PRD.

Figma structure: getting to the “aha” moment

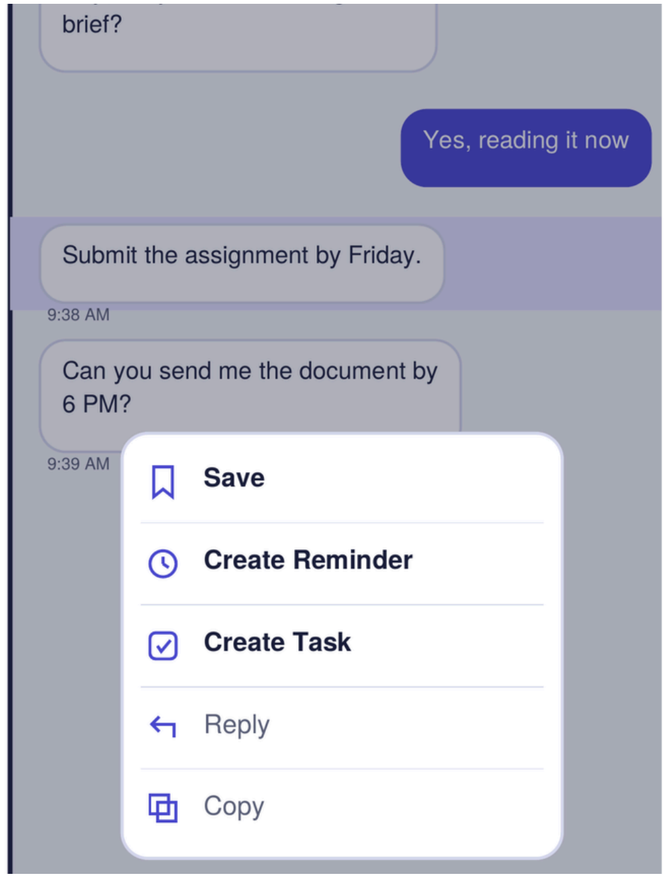

No separate onboarding screens were needed — the “aha” is reachable in 2 taps straight from the chat list.

1 · Chat list

2 · Conversation

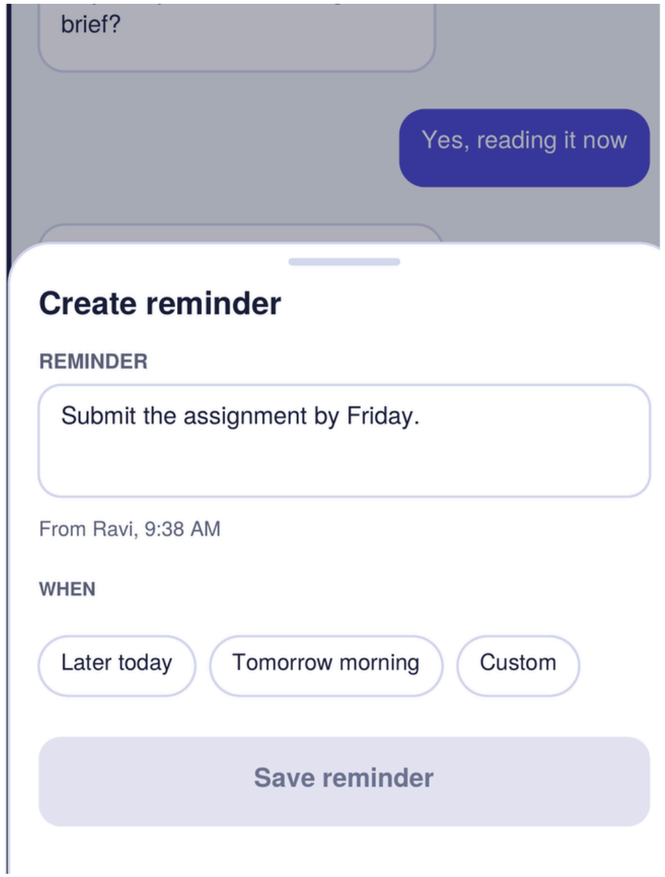

3 · Message Actions menu

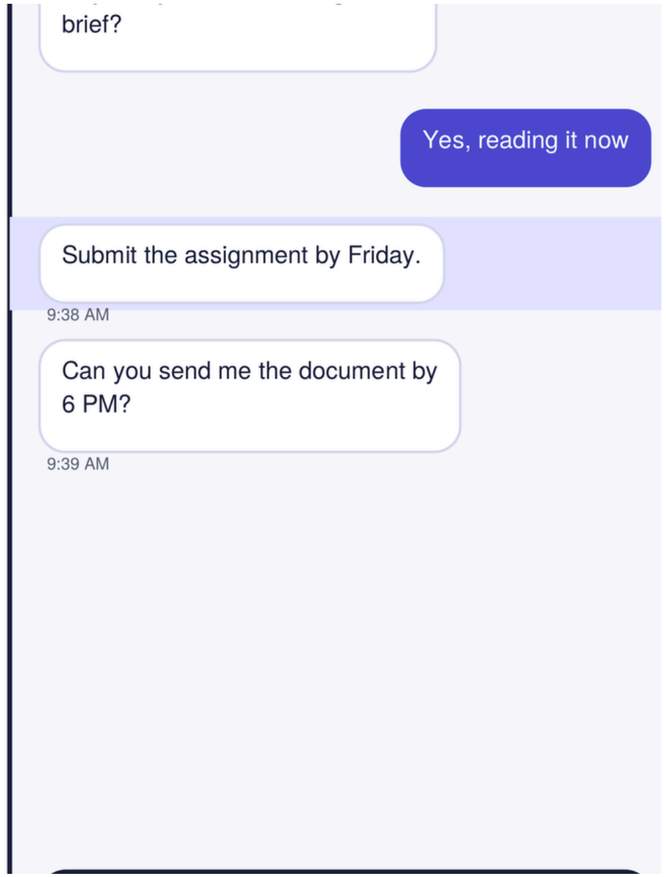

Tap a chat, long-press (or tap in this prototype) the message that matters — the menu opens right there, no new screen to load.

Figma structure: the main value loop

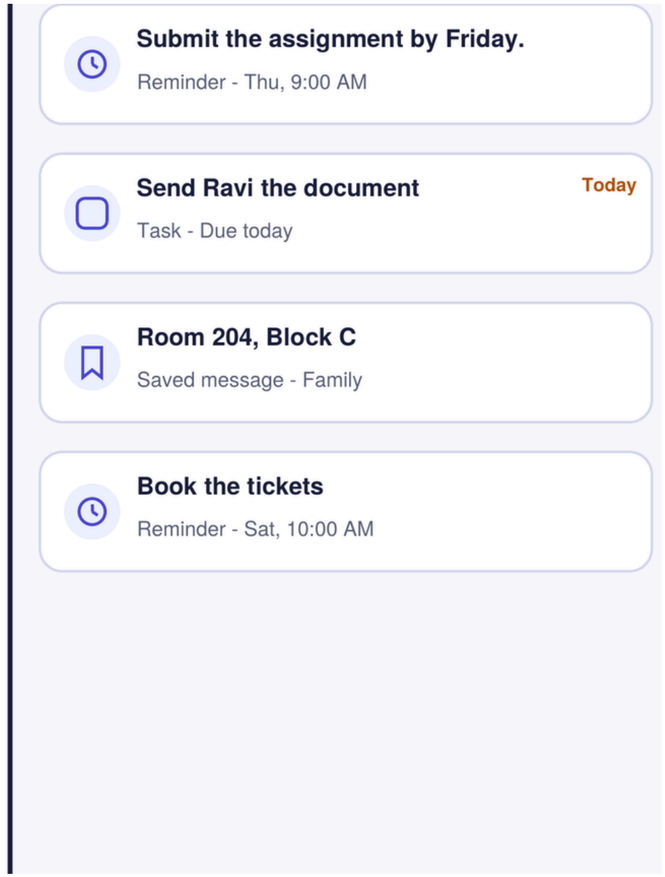

This is where repeat value lives — the Saved Actions hub is the screen a returning user opens most.

4 · Create reminder

5 · Confirmation

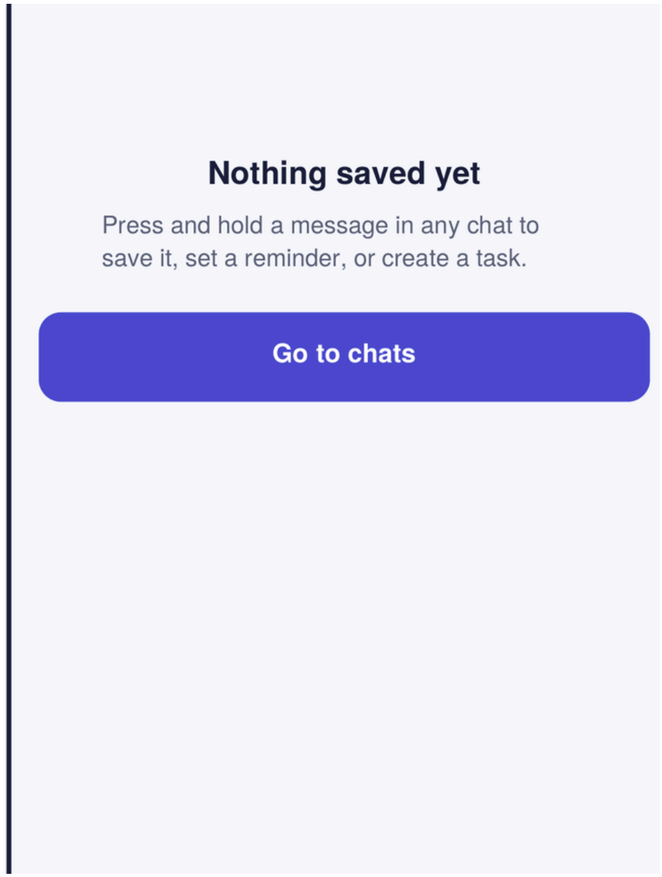

7 · Saved Actions

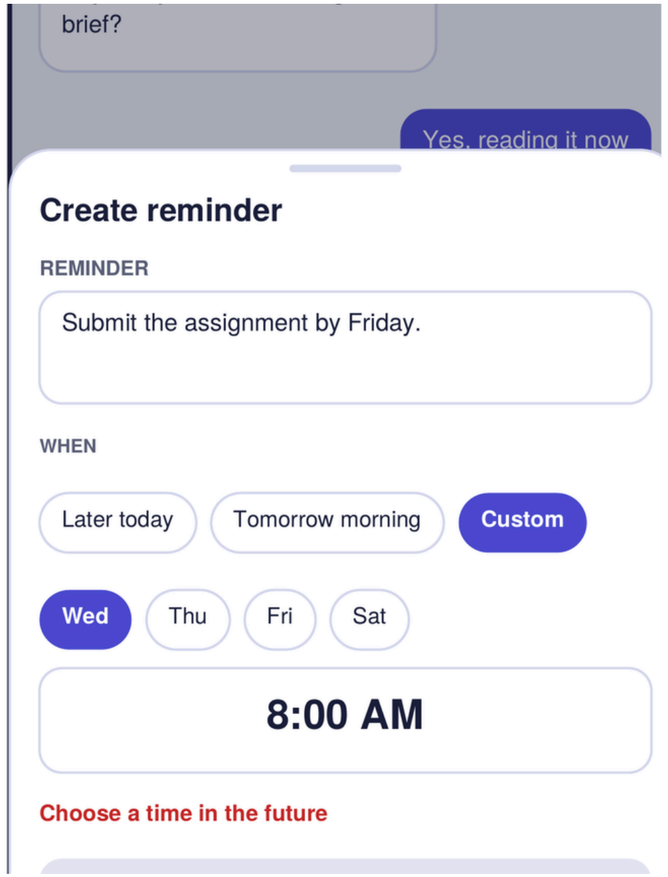

One required decision (the time), a prefilled text field, and a reversible toast — designed to cost the user as little as possible.

Figma structure: edge cases & error states

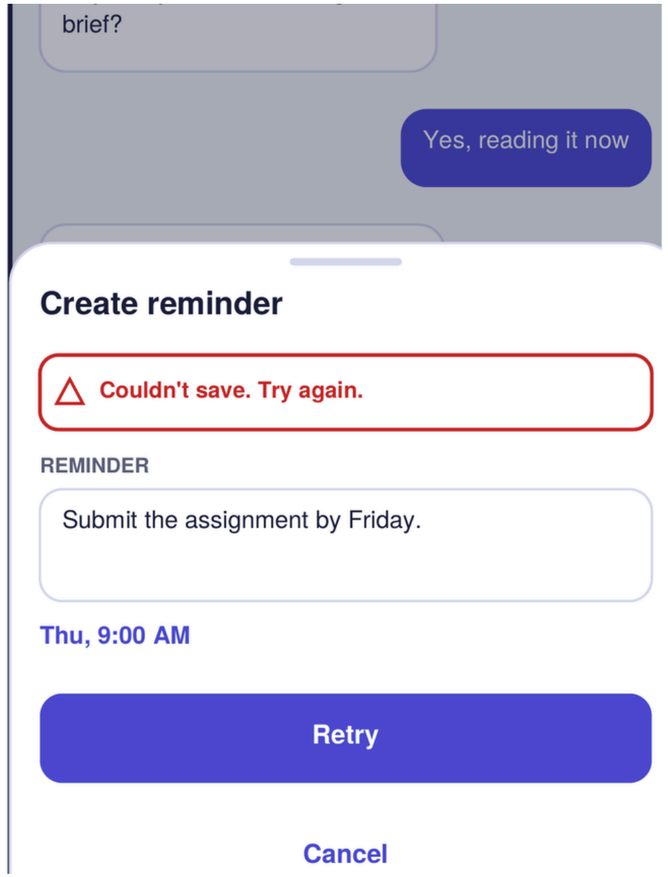

Proving PM rigor means designing for the unhappy paths too, not only the demo path.

13 · Empty state

14 · Invalid date/time

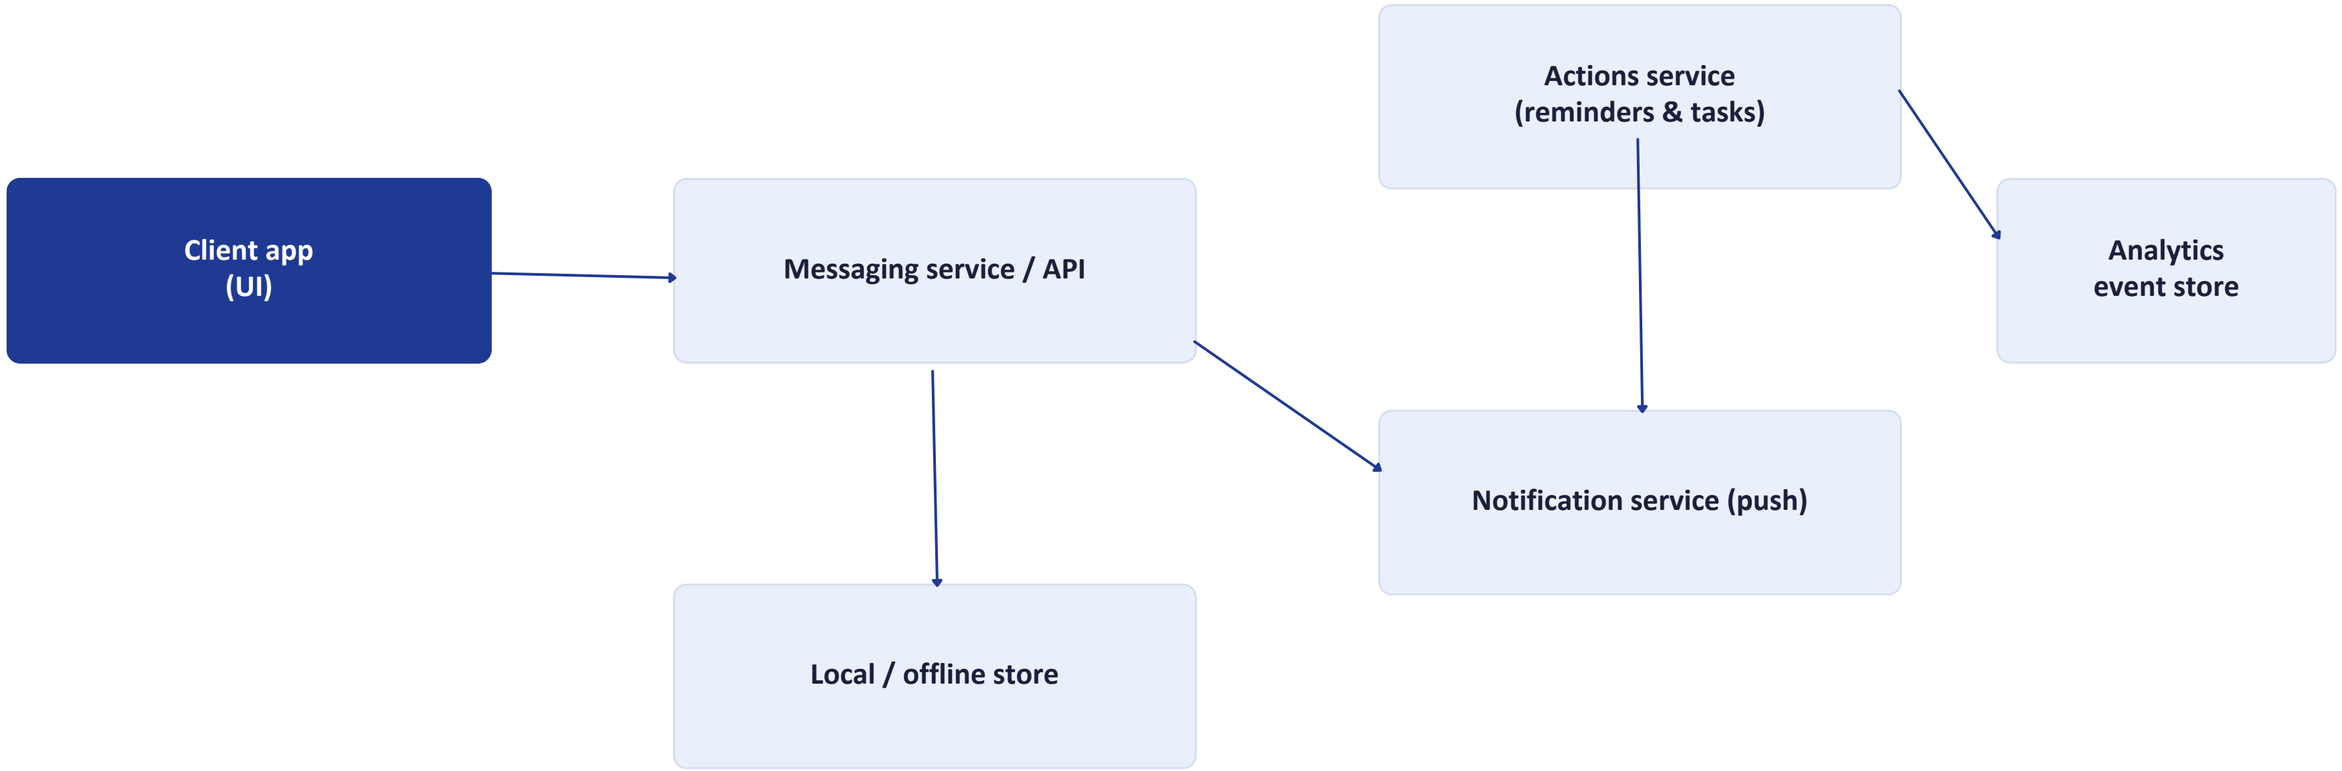

15 · Save failed / offline

Other mapped cases: duplicate reminders, deleted source messages, leaving a group, and reminders piling up (digest after 3+ in an hour).

System logic (conceptual)

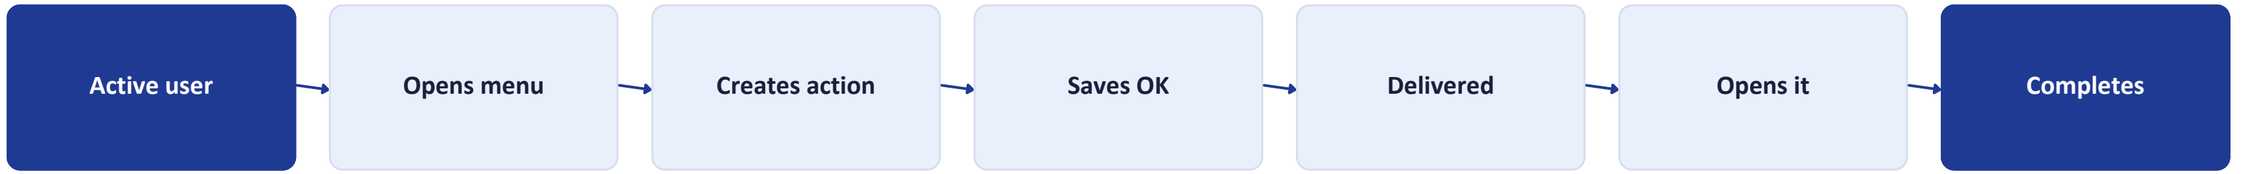

A simple block view of how data would move — a PM's mental model, not an engineering spec.

Actions carry a reference to the source message, not a copy of the chat — kept deliberately thin for privacy (see appendix PRD §19).

Not launched yet — here's how I'd know it's working

No usage data exists. Below is the measurement system that would turn on from day one of a real beta.

The Message → Action funnel — each stage has a named metric, a hypothesis for where users drop off, and a planned investigation (full detail in the appendix).

Activation (proposed)

First action created AND completed within 7 days of sign-up.

Retention lens

D1 / D7 / D30, plus action-users vs. non-action-users (correlational, not causal).

First experiment

Preset vs. blank reminder time — cheapest test on the highest-friction step.

Guardrails

Notification opt-out rate and dismissal rate — must not worsen as features ship.

All figures on this slide are placeholders / proposed targets — SIMULATED, not real results.

Feature Prioritization

All numbers are HYPOTHETICAL prioritization assumptions

Reach (1-10 relative scale: how much of the active user base would use it), Impact (0.25 minimal, 0.5 low, 1 medium, 2 high, 3 massive), Confidence (%), Effort (person-weeks, rough). They are chosen by the author to expose trade-offs and are not measurements. Re-score with engineering and real data.

#	Feature	RICE	Decision
1	Basic notifications (reminders)	4.27	MVP
2	Message actions menu	4.2	MVP
3	Create reminder	2.88	MVP
4	Saved Actions dashboard	2.4	MVP
5	Save message	2.4	MVP
6	Basic search	1.8	MVP
7	Create task	1.44	MVP (sequenced after reminder)
8	Smart suggestions	0.53	Next (test after manual path)
9	Cross-Platform Integration	0.06	Later

Product Roadmap

Ordered by evidence and dependency, not by a wish list — each horizon has a gate before the next one opens.

NOW

- Messaging core: 1:1 + group chat
- Message Actions: Save, Reminder, Task
- Basic notifications
- Search + Saved Actions hub

Gate: reminders deliver reliably; activation & completion measured in beta.

NEXT

- Events (shared, for groups)
- Smart suggestions
- Advanced search
- Fixes from real research

Gate: group demand shown; privacy review done on suggestions.

LATER

- AI organisation
- Calendar integration
- Cross-platform support
- Advanced automation

Gate: NEXT items proven; engineering capacity and legal review available.

Thank you — let’s talk

Questions, pushback and “why not X” are welcome. Here’s where to go deeper.
